BMJ 2016

## Predictors

Maternal age

Weight

Body mass index, before pregnancy

Body mass index

Blood pressure

History of gestational diabetes mellitus

Family history of diabetes mellitus (first or second degree)

History of chronic hypertension

Ethnicity

Parity

Poor obstetric outcome

History of macrosomia

Method of conception

Smoking

Glucose

# IMPLEMENTATION: Prediction model for GDM

**Age**  years

**Height**  cm

**Weight**  kg  
Weight measured at the initial hospital visit should be used to calculate the BMI

**Ethnicity**  
\*Other included Middle Eastern, Central Asian, European, and American origins

**Family history of diabetes**

**Past history of gestational diabetes**

---

**RESULTS**

**An early risk prediction tool for gestational diabetes (probability)**  
Probability of developing gestational diabetes mellitus is: **76%**

## AN EARLY RISK PREDICTION TOOL FOR GESTATIONAL DIABETES

The current model is intended to be used at the first-trimester of the pregnancy. This risk prediction tool identifies women at high risk of Gestational Diabetes Mellitus (GDM).

Research authors: Helena J. Teede, Cheryce L. Harrison, Wan T. Teh, Eldho Paul, Carolyn A. Allan

### Result interpretation

Temporal external validation of the model resulted in a c index of 0.703. Indicating a 70.3% probability that a randomly selected patient with GDM will receive a higher risk score than a randomly selected patient without GDM.

<https://www.evidencio.com/models/show/2106>

# Prediction of GDM complications

PerSONAL GDM model

composite outcome: hypertensive disorder of pregnancy, large-for-gestational age neonate, neonatal hypoglycaemia requiring intravenous therapy, shoulder dystocia, perinatal death, neonatal bone fracture and nerve palsy

fasting and 1 hour post load glucose from the diagnostic OGTT

gestational age of GDM diagnosis

previous macrosomia or LGA

previous pre-eclampsia

Ethnicity

weight at GDM diagnosis

parity

## Physical activity advice for expectant mothers – Chief Medical Officer

Date published: 29 June 2017

Topics: Professional medical and environmental health advice, Midwifery

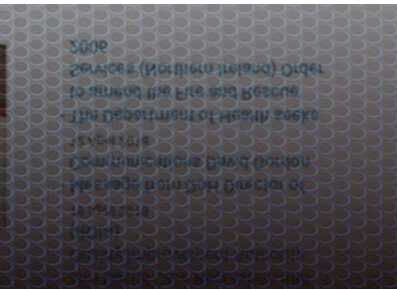

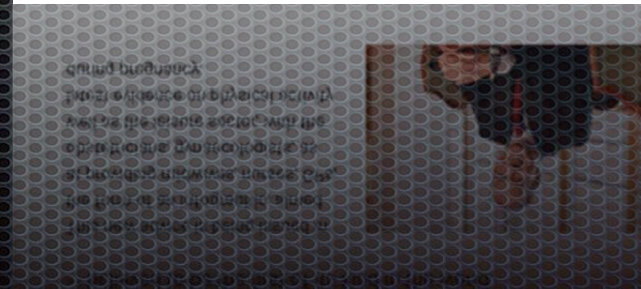

Chief Medical Officer, Dr Michael McBride, along with his counterparts in England, Scotland and Wales, have jointly released new advice on physical activity for expectant mothers – believed to be the first of its kind in the world.

This new advice is being issued in the form of an infographic, aimed at providing midwives, nurses, GPs, obstetricians, gynaecologists, as well as the leisure sector, with the latest evidence on physical activity during pregnancy.

# Prevention of Type 2 diabetes after GDM

# Prevention of Type 2 diabetes after GDM

Views of women and healthcare professionals

- 80% of women in this survey were **not ready to engage in a postpartum lifestyle intervention** within the first 6 months of giving birth
- 52% of health professionals recommended they should be engaged in the first six weeks
- A **community setting** was preferred to a medical one
- Mothers wanted **recipe ideas** (95%) in preference to general dietary advice (76%) or cooking skills courses (39%)
- **Walking** was the main form of exercise for 79% of mothers

**Women highlighted difficulty in focusing on their own health goals because of competing demands of looking after a baby**

# Prevention of Type 2 diabetes after GDM

Views of women and healthcare professionals

- OMAHA pilot - continuing metformin after delivery in postnatal period to prevent GDM

- MERIT – Mediterranean diet in postnatal period to prevent GDM
